

Process through Sensory → Short Term → Long Term Model

FIRST TIME THROUGH

<b>What Part</b>	<b>Description</b>	<b>Processes</b>
Environment	Hear something, see something	
Sensory Memory	goes into sensory memory	broken down by senses filters
Short Term Memory	some goes into STM, usually questions pop up or things are organized	What was on your mind? (or default schema)
LTM → STM	get some stuff from LTM to relate to questions in STM, or just random crap related to stuff in STM	What's related?
Short Term Memory	re-organize / chunk / process stuff	Again, what's the question on your mind?
STM → LTM	the more re-organized, the more it stays that way in LTM (effortful processing)	Some pieces stuck into schemas
