

Process through Sensory → Short Term → Long Term Model

EACH TIME EVENT IS RECALLED - end of day, next day, next week...

What Part	Description	Processes
Environment	“How was your day?”	
Sensory Memory	Might miss parts of the question, hear background noise, etc.	
Short Term Memory	start searching for answer	What was on your mind? (or default schema)
LTM → STM	That chunk related to original memory comes up, with other stuff, because it’s related to the current question. Probably chunks from each part of LTM	***** What is on their mind when recalling the info? What info is related to this question? *****
Short Term Memory	re-organize / chunk / process stuff	→ in order to answer current question
STM → LTM	you put new chunks along side or on top of old chunks. The recent chunk is recalled first.	

Each time, you pull from LTM the *results from the previous chunking*.
